

REST Crud Challenge: Create a CRUD for **tags**

1. In `/resources/views/layouts/app.blade.php` add the navigation for "Tags", next to "Hobbies" on the right. Use a wildcard (with `*`) for the highlight.
2. Create a resource route in `/routes/web.php` for the tags.
3. Create all files with `php artisan make:model Tag -a`.
4. Fill in the migration file for the tags table - we need the 2 fields "name" and "style" which are both Strings. Run the migration with `php artisan migrate`.
5. In the new database table create 2 test records:
name: 'Sports', style: 'primary'
name: 'Relaxation', style: 'secondary'
6. Copy the folder `/resources/views/hobby` completely into `/resources/views/tag`
7. Copy and adapt the "fillable" settings from the Hobby model into the Tag model.
8. Fill all the function in TagController (`app/Http/Controllers/TagController`). Tipp: Copy the contents of each function from the *HobbyController* one by one into the *TagController* and adapt them. **Caution!** You do NOT need to do the `show()` method! :-)
9. Adapt all the views for the tags. Delete the `show.blade.php` because we do not need it. We only need the index, create and the edit-view! Adapt the forms and the HTML, in the Index-View remove the links to the show-view, and take care that all buttons and links are correct.
