

Challenge: Create a detailpage for a user

[Link to the lecture >](#)

1. In `/routes/web.php` create a resourceful route with:
`Route::resource('user', 'UserController');`
2. In a new window of your Command line interface show the routes list for the new user resource routes with `php artisan route:list --name=user`
3. In this list, copy the URI that leads to the show method.
4. Go to the **hobby index view**, and where we display the users name, wrap this output with a link and **insert the link** that you just copied.
5. Make this link dynamic by replacing `{user}` with the **dynamic user id**.
6. In the folder **/resources/views** create a new subfolder "user".
7. Copy the view `/resources/views/hobby/show.blade.php` to **`/resources/views/user/show.blade.php`**
8. Adapt this new "show.blade.php" by using the `$user->name` as a headline and also display the user's motto and the user's `about_me` database field.
9. Copy the body of the **show() method** from the HobbyController into the **UserController** and adapt it.
10. Have fun! ;)
